How to use the Igni-Power software?

1. Install the software on the computer by following the menu
 - Insert the delivered CD to the computer
 - Choose the language which is suitable
 - Choose the mode how the program should be run
 - Choose the directory where the program should be installed or use the default address
 - Choose the serial interface of the computer to communicate with the ECU of the engine or use the default interface address (com1).
 - Finish the Setup program
2. Connect the interface with the ECU of the engine.
Note: the ECU has to be connected to the engine
3. Start the ***Igni-Power Racing 3Cyl*** software
4. For communication with the engine ECU switch the ignition on

5.

What are the important functions to steer through the program?

New: Ctrl+N

Restore the default settings to the actual mapping which is currently used on the computer.

Open: F3

Open an existing file from any directory

Save: F2

Save the modified file to the computer

Note: it is not stored to the engine ECU (Electronic Control Unit)

Print: Ctrl+P

Print the currently opened map

Read the actual settings from the ECU to the computer

Compare the settings from the computer with the mappings from the ECU. If there are differences the programm will ask whether the ECU parameters should be updated or not.

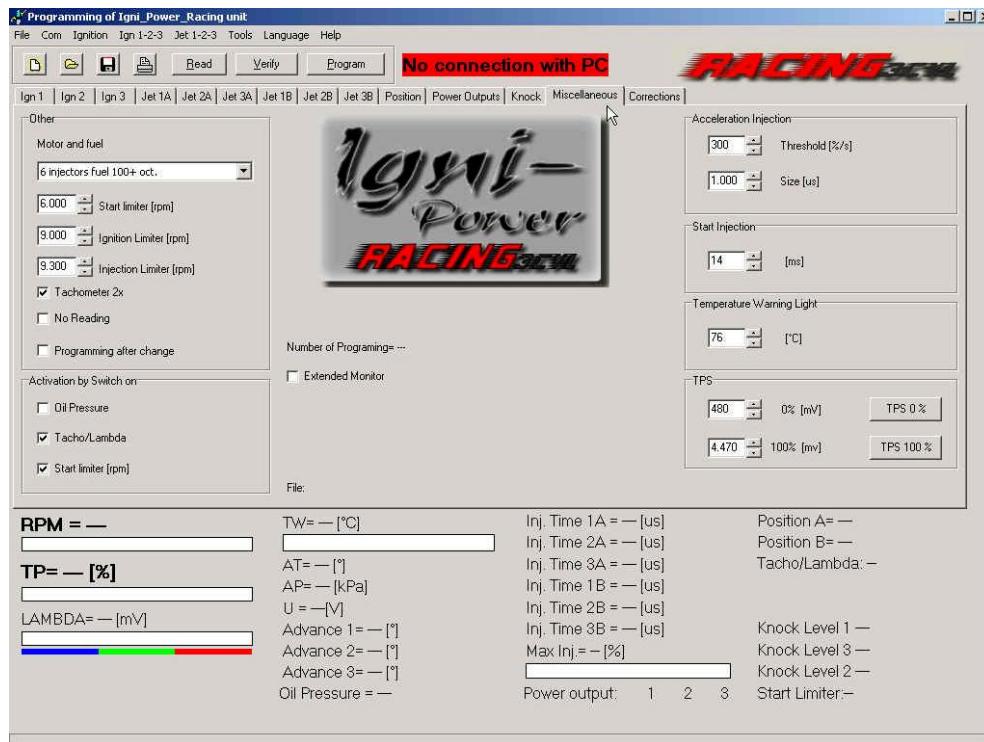

Program the actual parameters from the computer to the ECU.

Engine Settings (1)

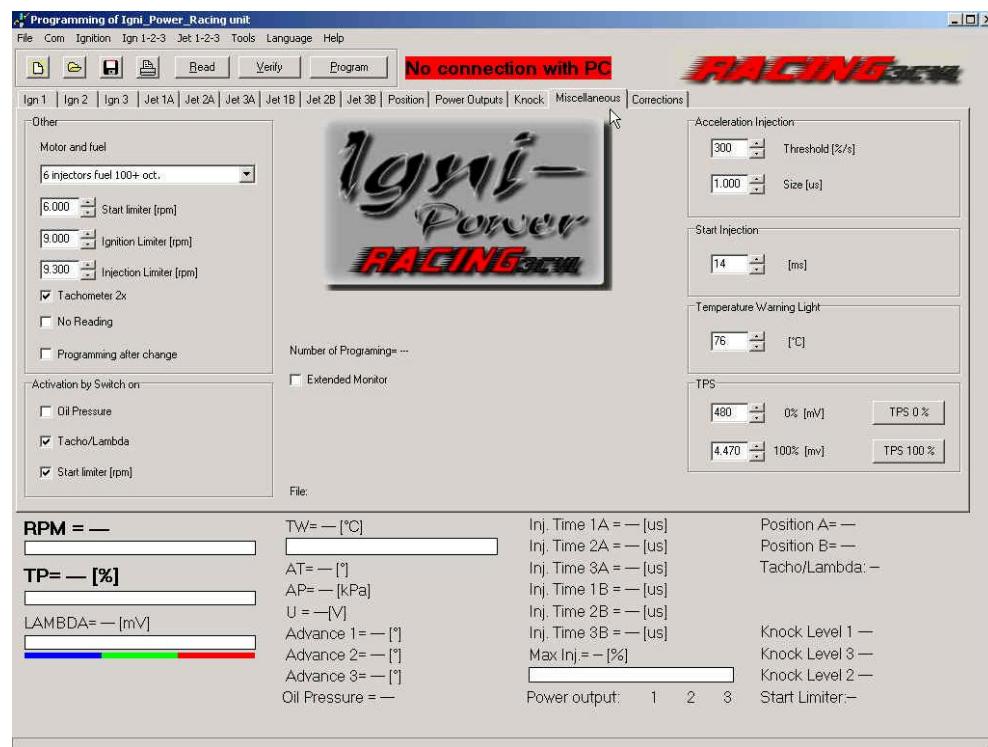

Open the map **Miscellaneous**

- Choose the engine parameters **Motor and fuel**
 - * 6 injectors and fuel type 100+ octane
 - * 6 injectors and fuel type 98 octane
 - * 3 injectors and fuel type 100+ octane
 - * 3 injectors and fuel type 98 octane
- by choosing the correct amount of injectors and the fuel type the basic mapping will be set. This mapping should be used as a reference.
- Set the **Start limiter** rpm
This limited engine speed is activated by pushing the rev. limiter button on the handlebar of the boat.
Range: 900 ... 12500 rpm
- Set the **Ignition and Injection limiter**
These limiters prevent the engine to exceed its maximum mechanical speed limit. The strategy is to limit the rpm first by the ignition and than by the injection.
Range: 900 ... 12500 rpm
- Choose the type of the tachometer. The output signal can be doubled.
- No Reading: working offline
- Choose if every change of the map setting should be stored to the engine ECU immediately.
- Set the flags when the extended monitor (display) should be activated
 - oil pressure: > 0.3 bar
 - Tacho / Lambda: engine speed > 1000 rpm
 - start limiter: > above set value
- Set if the extended online monitor should be activated.

Engine Settings (2)

➤ Acceleration Injection:

Determines the acceleration enrichment or leaning time and value.

Threshold [%/s]: This value determines what is an acceleration. It is calculated by the throttle position [%] and the time [sec] when it is reached. All values below this value are steady state and will use the original fuel mapping.
Range: 10 ... 2500 %/s

Size [μs]: Determines the time of this acceleration function of how long it should be activated. This value is added to the fuel mapping.
➤ starts as soon the threshold value is true
Range: 0 ... 7500 μs

➤ Start Injection:

As soon the engine start button is pushed the injectors will inject fuel for the specified time. This choke function is independent from any synchronization of the crankshaft position with the ECU.

➤ Temperature Warning Light:

Threshold value when the engine temperature should be activated. This function has no influence to any other map.

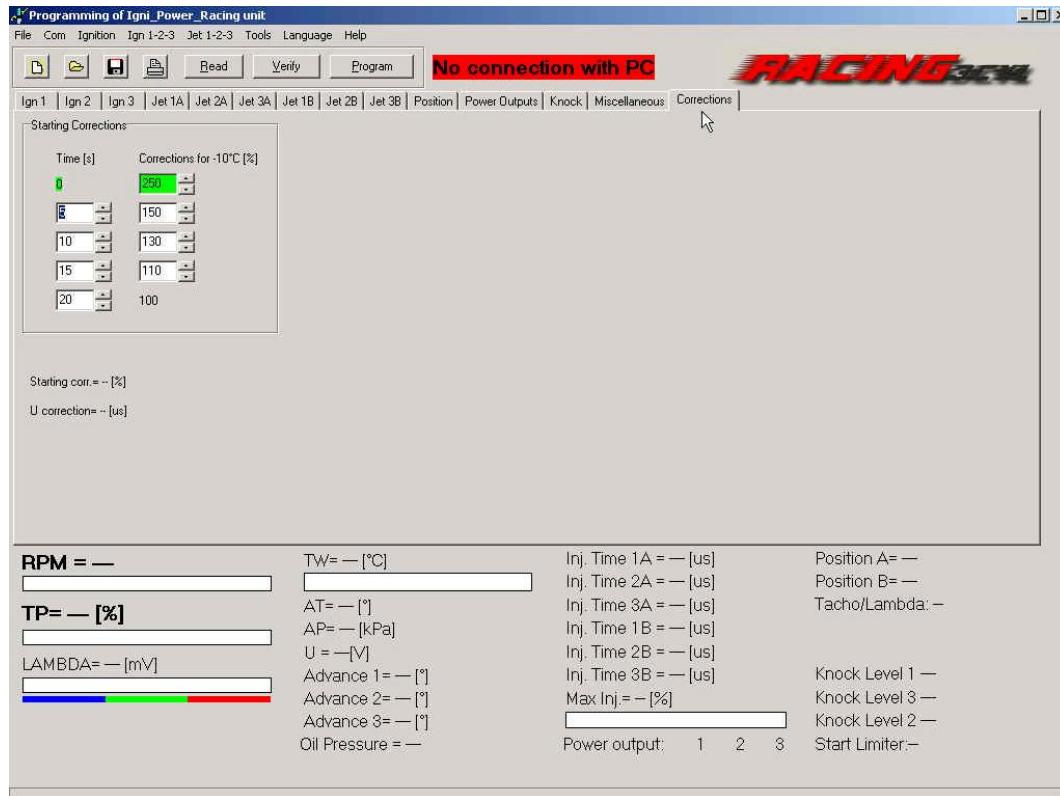

➤ TPS – Throttle Position Sensor:

1. Release the throttle completely and click **TPS 0%**
2. Open the throttle to WOT and click **TPS 100%**
3. **Program** the values to the engine ECU.

Engine Corrections

➤ Starting Correction:

With this map the cold start behavior of the engine can be adjusted.

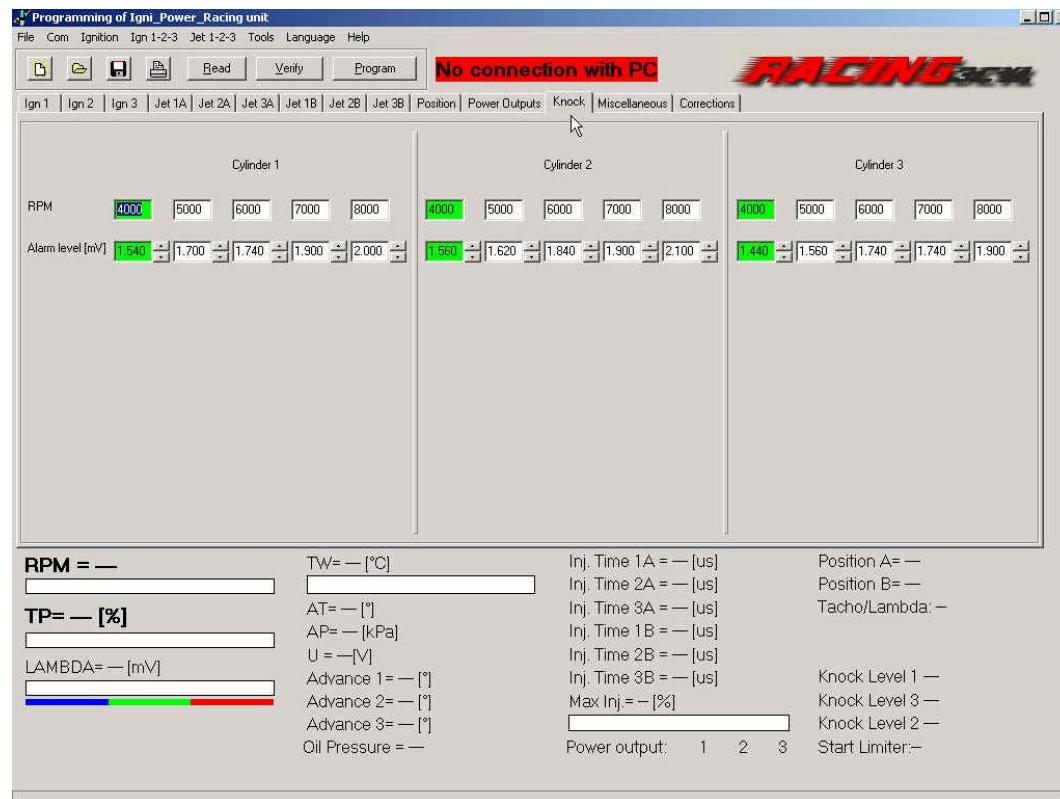

Time [s]: Defines the time of how long this function is enabled.

Correction for -10°C [%]: This table allows to adjust the default engine settings.
Range: 100 ... 350%

Igni-Power Racing 3cyl

Knock Sensor Setting

➤ Knock:

This table allows to adjust the Knock Alarm levels of each cylinder separately.

Cylinder 1: PTO side

Cylinder 2: Center

Cylinder 3: MAG side

The adjusted levels result in an earlier or later activation of the alarm which can be seen on the extended display. The default knock setting of the engine will not be modified. This function should be used as a reference for the new modifications.

Range: 500 ... 5000 mV

Igni-Power Racing 3cyl

External Power Output Drivers

➤ **Power Outputs:**

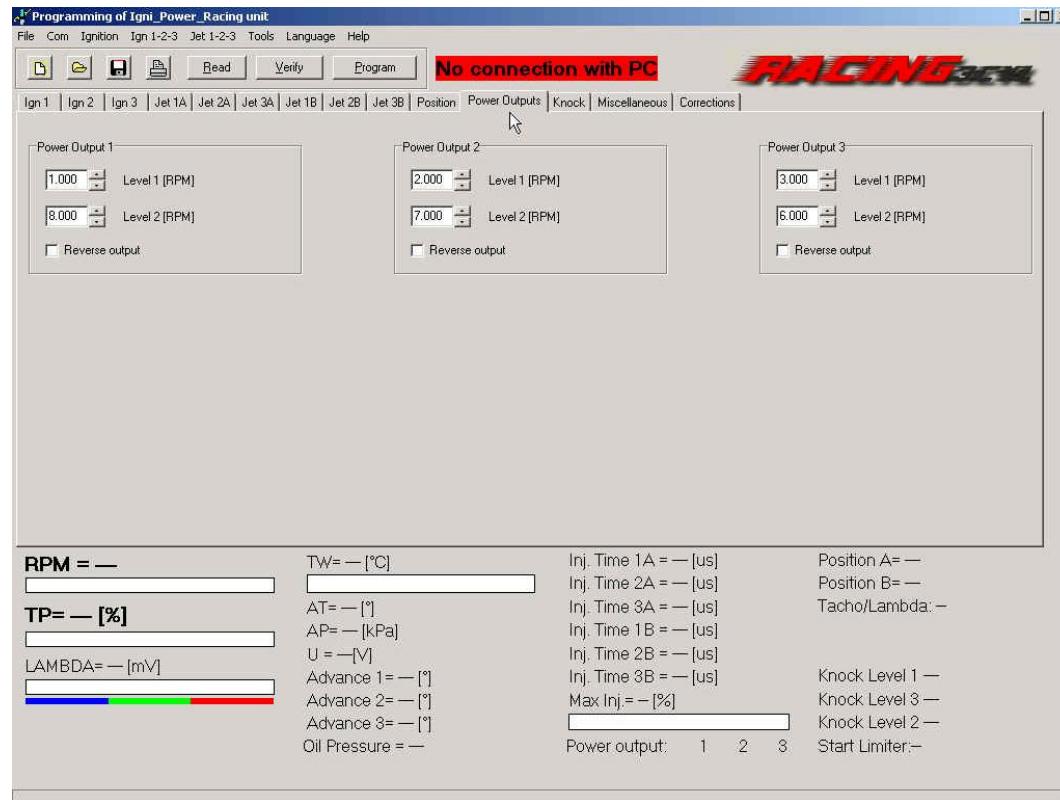

This ECU – Electronic Control Unit allows to control three different outputs separately. Therefore two switching engine speed [rpm] levels can be set. Furthermore the output signal can be inverted.
Range: 0 ... 12500 rpm

Note:

General Description

N channel vertical power switch FET in Smart SIPMOS® chip on chip Technology.

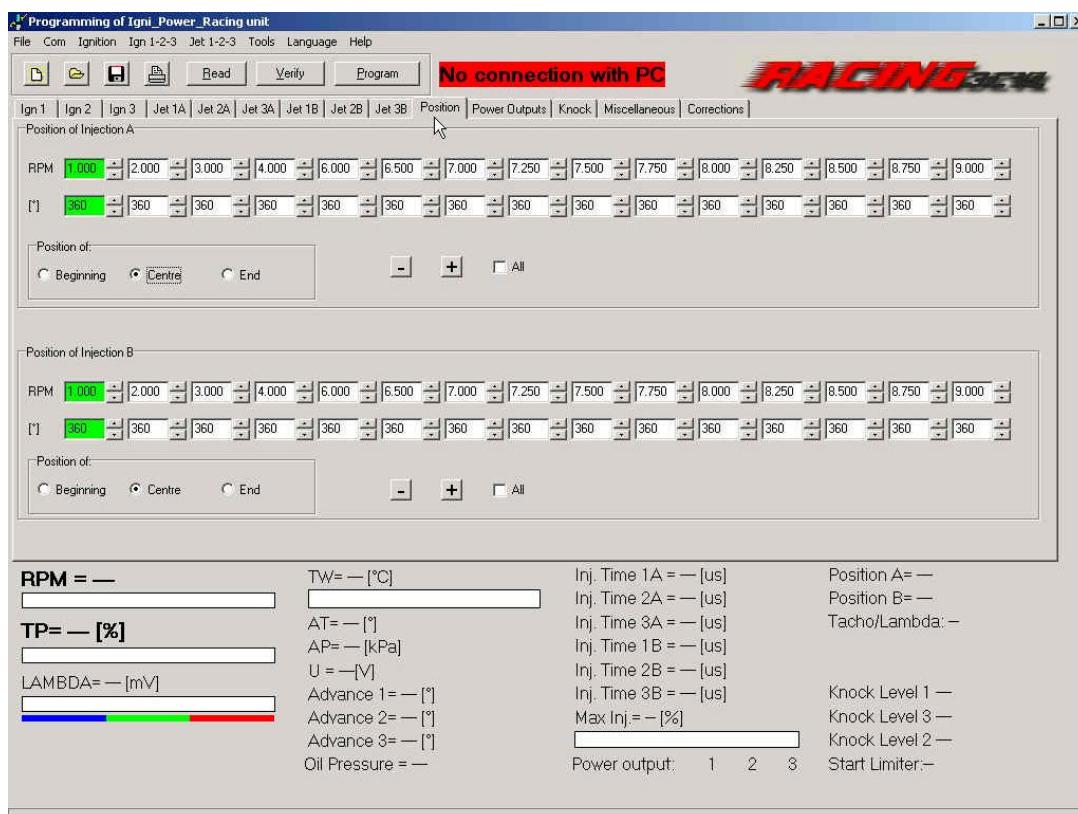

Output specifications: **12V, 3,5A**

Position of the Injection Start

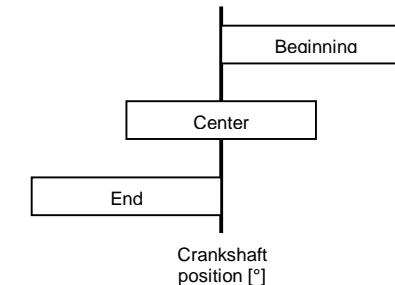

➤ Position of Injection:

The mapping specifies the initial starting point of the injection relatively to the crankshaft. Three different calculation methods can be chosen.

Beginning: the set value is the starting point of the calculation of the injection time.

Center: the set value is exactly in the middle of the injection time.

End: the set value determines the end of the injection.

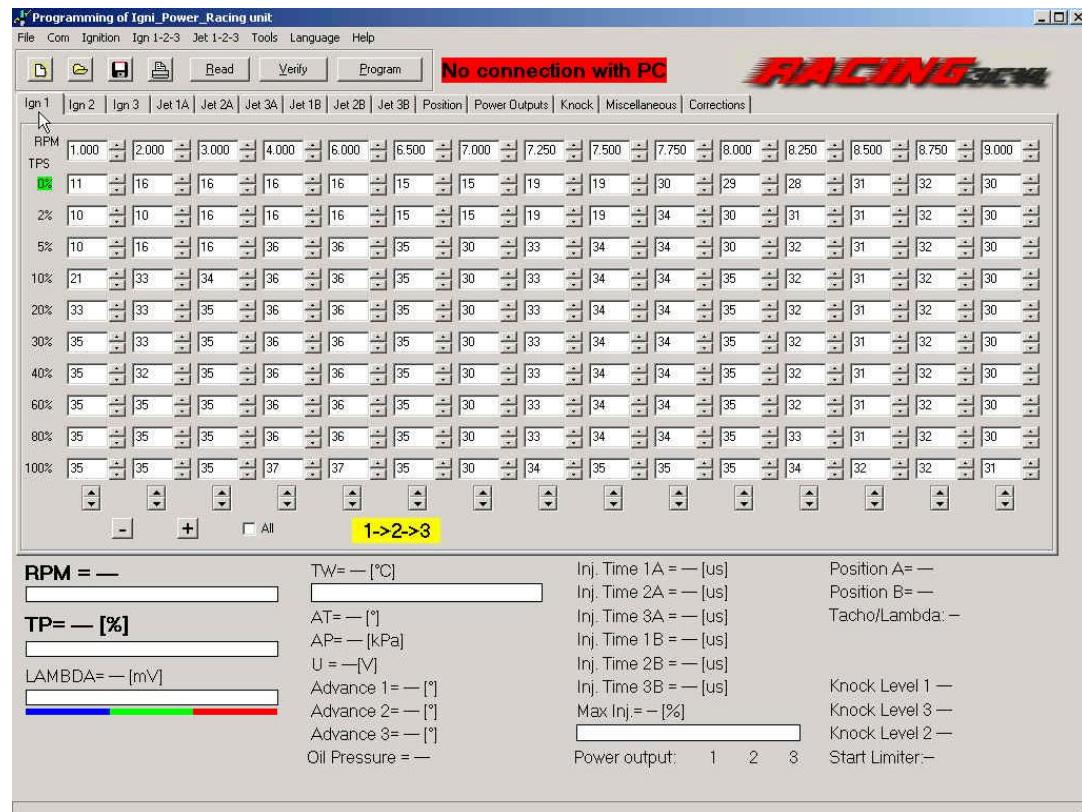

Injector A: Injector positioned on top of the intake manifold.

Injector B: Injector positioned below of the intake manifold.

Ignition mapping

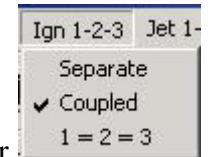

Principal function:

The ignition table is a function of the Throttle Position (TPS) over the engine speed (RPM).

How to use the table?

- The basic engine ignition settings are stored in the default value.
- Choose the engine configuration (6 or 3 injectors, fuel type) in the sheet Miscellaneous.
- press the button  to restore the default settings

The ignition timing can be set for each cylinder individually or dependant.

- Choose the adjustment mode from the menu bar

Separate: the mapping for each cylinder has to be done individually

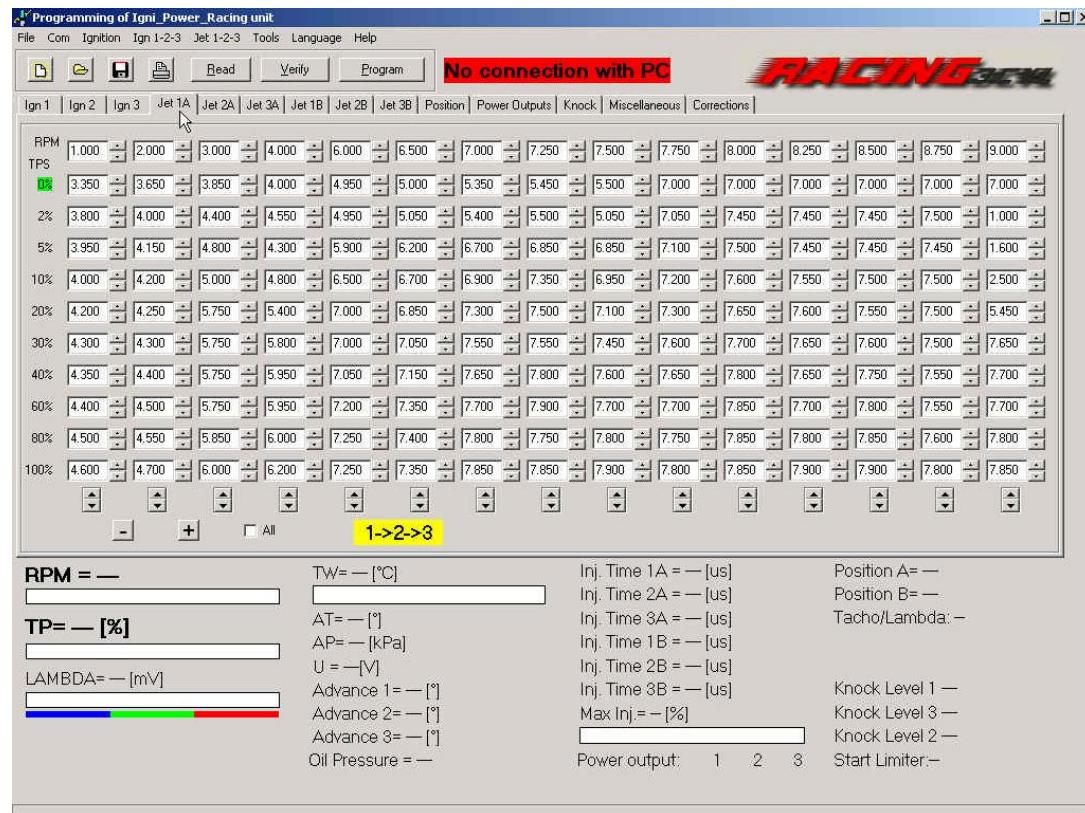

Coupled: the default mappings for cylinder 2 and 3 will be modified by the same amount as the cylinder 1 has been adjusted

1 = 2 = 3: only the mapping of cylinder 1 can be modified.
Cylinder 2 and 3 will have the same values
